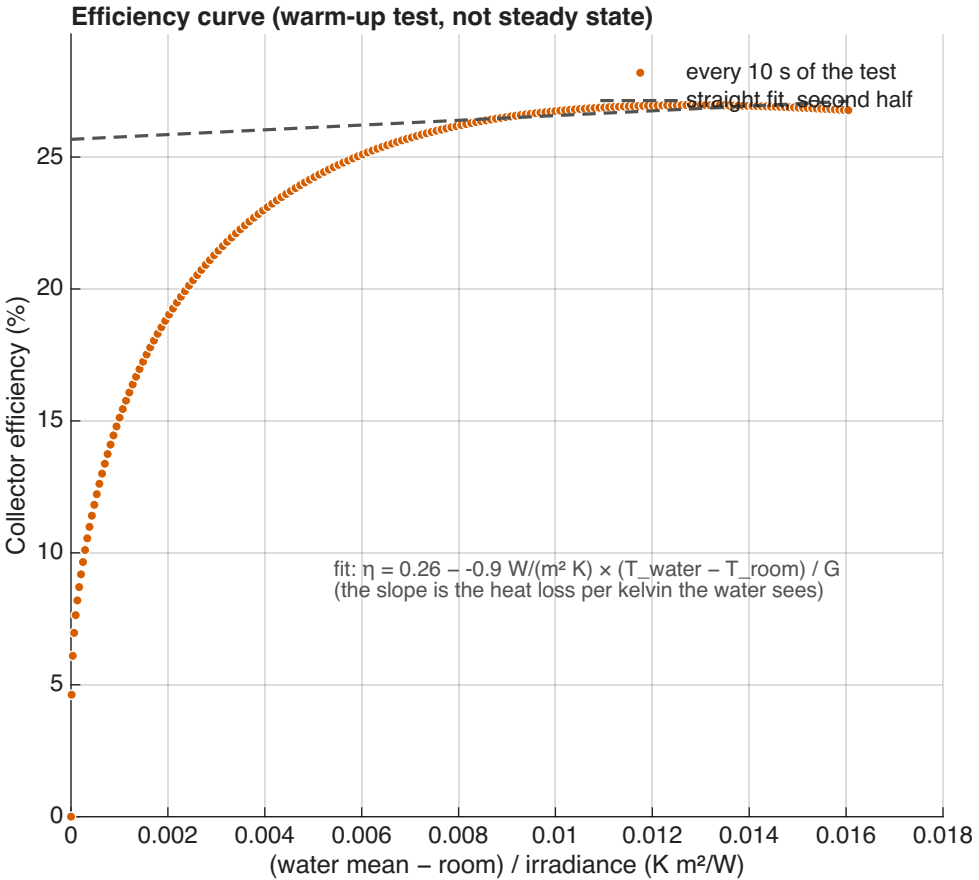
Efficiency over time
Efficiency (% of light on the footprint)
Time (min)
20.4 % at 30 min
Collector: heat into the pipe water
Water gain (after vessel loss)
Running average of water gain



Efficiency curve (warm-up test, not steady state)
every 10 s of the test
straight fit, second half
Collector efficiency (%)
fit: η = 0.26 – -0.9 W/(m² K) × (T_water – T_room) / G
(the slope is the heat loss per kelvin the water sees)
(water mean – room) / irradiance (K m²/W)
